

AUCKLAND, New Zealand, 28 September, 2026 – OpSys Solutions Ltd has announced updates to its after-hours HVAC scheduling platform, 7NOX. Version 4.0.5 introduces major new functionality for building administrators and tenants, including a new Building Manager, flexible Billing Groups, and smarter booking tools.

Release highlights

- New Building Manager for administering building structure, zones and naming, with a guided Migration Wizard for existing sites.
- Billing Groups let administrators group zones (by tenant, department or floor) and bill them under a single group rate.
- Holidays can now be defined as multi-day date ranges in a single entry.
- Booking cost forecast shows users an estimated cost before a booking is confirmed.
- Users can now view bookings that are currently in progress.

What's new in 4.0.5

Building management

Building Manager. A new Building Manager interface gives administrators a single place to set up and maintain a building's structure, including levels, zones and tenant assignment. For existing sites, a step-by-step Migration Wizard guides administrators through transitioning legacy zone codes to the new naming scheme, with a full preview of changes before anything is applied.

Billing Groups

Billing Groups. Administrators can now group zones into Billing Groups representing tenants, departments or entire floors. Each group is billed at its own group rate, and overlapping bookings within a group are merged so tenants are only billed once for concurrent runtime. Invoices include a dedicated group billing section alongside standard individual bookings, keeping charges clear for both tenants and accounts payable. Zones can be grouped as separate, bookable zones OR as combined zones for one booking and charge.

Scheduling

Multi-Day Range in Holidays. Holidays and shutdown periods can now be entered as a date range rather than one day at a time. A single entry can cover long weekends, seasonal closures or extended shutdowns, reducing setup time and the risk of missed days.

View In-Progress Bookings. Users and administrators can now see bookings that are currently running, making it easy to confirm that after-hours air conditioning is active and to see when the current booking ends.

Booking experience

Booking Cost Forecast. Before confirming a booking, users now see a forecast of the booking's cost based on the applicable rates for their site, tenant, zone or billing group. This gives tenants cost certainty up front and reduces billing queries after the fact.

The 7NOX app is a cloud-based web app that automates the scheduling of after-hours HVAC requests. OpSys Solutions Ltd is a hardware and software developer of building integration products.
